PRODUCT OVERVIEW

AFE WORKFLOW

Connect Your Field to Finance with Integrated Capital Governance

Built for engineering and field teams, AFE Workflow makes managing AFEs easy without navigating an ERP. Capture and track capital requests across drilling, completions, workovers, recompletions, and facilities. Create AFEs on the web, review and approve them through a mobile app, and monitor approval status and budgets across your AFE pipeline.

- Part of the WorkStream suite. Available as an independent module.

With W Energy's AFE Workflow, the drilling and completions program ties directly into the economics of the project, in real time.

The AFE Workflow Advantage

AFE Management the Way Your Team Works
Customize templates, fields, and approval flows by project type. Enforce authority limits and dollar-based routing. Link parent-child and supplemental AFEs at the asset, unit, pad, and well level.

Bring the Right People into Every Review
Gather cross-functional input before formal approval. Attach supporting documents, route partner elections, and track responses with working-interest percentages from division order data.

AI Assistance for Smarter Capital Decisions
AFE Workflow's integrated AI flags variances, anticipates overruns, benchmarks comparable wells, suggests adjustments, and generates reports using historical data and WellWork information.

Key Features: AFE Workflow

Collaboration
Simplify drafting, gather review comments, keep documents attached throughout routing, and track partner elections.

AFE Structure
Configure templates, link parent-child and supplemental AFEs, and standardize project information and cost coding across companies and project types.

Approvals & Accountability
Route approvals by rules, enforce authority limits and dollar-threshold escalation, and keep decisions moving with email notifications and mobile approvals.

Budget Visibility
Monitor portfolio status, commitments, and spending, compare budgets against actuals, and flag approaching limits through built-in analytics and dashboards.

Integration
Sync approved AFEs with W Energy Accounting, track WellWork field costs, and connect economics, reserves, well, facility, and document systems.

AI & BI
Ask AFE questions, anticipate overruns, benchmark well costs, and connect preferred BI and AI tools through DataView and MCP.

BETTER TOGETHER

One Project. A Shared View of Cost and Progress.

WorkStream's shared data model and single well ID architecture help teams maintain consistent project information across modules and reduce duplicate entry. Field teams, engineers, and finance can work from connected records instead of piecing together updates from separate systems.
